Jonathan Yu - 30-60-90 Plan

Target Role: AI Success Engineer

Team: AI Success

Location: Remote - US

Compensation: $234K-$260K + equity

OPERATING THESIS

Customer adoption roadmaps, technical readiness, account health, KPI baselines, enablement, expansion signals, human-owned build process, workflow prototyping, and validated customer artifacts.

The first 90 days should prove three things: fast product fluency, useful customer or learner empathy, and one repeatable operating asset that improves adoption beyond a single account or course.

FIRST 30 DAYS - LEARN, MAP, AND SHIP A SMALL USEFUL ARTIFACT

- Learn OpenAI's AI Success playbooks, account-health signals, product surfaces, and escalation paths with Solutions, Product, and Research.
- Shadow customer calls to understand recurring blockers in configuration, use-case selection, security review, and executive alignment.
- Build a use-case intake template that captures workflow, stakeholders, success metrics, data/security concerns, and first production milestone.
- Define a personal account-readiness checklist for adoption velocity, champion coverage, and measurable value.

DAYS 31-60 - PILOT, PACKAGE, AND MEASURE

- Own a small portfolio or workstream and convert customer goals into adoption roadmaps with sequence, milestones, owners, and KPIs.
- Facilitate workshops that help customer teams identify high-impact use cases and champion-building motions.
- Create value-realization reports that connect baseline, deployment activity, adoption depth, and business outcomes.
- Surface technical blockers and field patterns to Product and Solutions Architecture with concise evidence.

DAYS 61-90 - SCALE THE PATTERN

- Drive multiple accounts toward production adoption with clear account-health reporting and expansion opportunities.
- Standardize repeatable enablement assets for common customer workflows and product configurations.
- Deliver a portfolio impact readout covering activation, adoption depth, stakeholder alignment, and measurable value.
- Create a feedback loop that turns repeated customer blockers into product proposals, documentation improvements, or services motions.

HOW I WOULD MEASURE EARLY SUCCESS

- I can clearly explain the role's priority product surfaces, customer or learner personas, adoption blockers, and internal handoff model.
- I have shipped at least one artifact the team can reuse: a demo, template, pathway, checklist, playbook, messaging matrix, or account plan.
- My work produces evidence: workshop feedback, adoption movement, content quality improvement, product feedback, or clearer stakeholder alignment.
- I have built trust with the immediate team by being useful, precise, and willing to do the hands-on work.

REVIEWABLE BUILD PATTERN

- For each customer-facing artifact, document the problem, process, output, validation, limitations, and role relevance.
- Use Codex-style workflows to prototype, inspect, refactor, test, and document product changes.
- Identify what AI accelerated, what Jonathan owned, what evidence was checked, and what limitation remains.
- Treat the prototype plus reasoning, constraints, testing, and customer story as the actual signal.
